## BACKGROUND

- BIC/FTC/TAF co-formulation showed excellent efficacy and tolerability in randomized clinical trials as switch strategy in people living with HIV (PLWH) virologically suppressed, while in real-life setting effectiveness need to be further investigated especially among some subgroups:
- Older PLWH is a growing population among HIV, with increased levels of comorbidities, polypharmacy and drug–drug interactions.
- Sex-related factors influence ART outcomes and wellbeing of PLWH. Women are historically differentially affected by ART side effects

## AIM

Evaluate the effectiveness of BIC/FTC/TAF in ART-experienced virologically suppressed (VS) people living with HIV (PLWH)

## STUDY DESIGN AND METHODS

**Study Design:** Observational study including ART-experienced VS PLWH from the Icona cohort who switched, for the first time to BIC/FTC/TAF from Apr2018 to Dec2021.

### Exposure of interest:

- (1) Age ( $\geq 50$  years old);
- (2) Sex (Female);
- (3) Switching from NNRTI-based regimen

**Primary Endpoint:** Time to treatment failure (TF) i.e. virological failure (VF: 2 HIV, RNA >200 copies/ml or 1 >1000 copies/ml) or treatment discontinuation (TD) for any reason.

**Secondary Endpoints:** (1) Time to TD for any reason; (2) Time to TD for toxicity/intolerance; (3) Time to VF in intention to treat analysis; (4) Changes in CD4, CD4/CD8 and weight at 12 ( $\pm 3$ ) months from switch.

**Statistical Analyses:** Standard survival analysis (Kaplan-Meier curves (KM) and log-rank test), the probability of different endpoints has been estimated at 1-year from BIC/FTC/TAF start according to the different exposures of interest.

Unadjusted and adjusted hazard ratios (HR) of the primary endpoint TF and of TD, TDT, TDS and VF have been estimated by fitting Cox regression models according to main exposures of interest

## RESULTS

**1237 PLWH included:** 544 (44.0%) >50 years, 229 (18.5%) female, 95 (5.7%) switching from NNRTIs (of whom 47 switching from EFV). Patients' characteristics are shown in Table1

Table1 – Patients' Characteristics

	ART-experienced VS (N=1237)	
Italian, n(%)	1043	84.3
Ethnicity, Caucasian, n(%)	1102	89.1
Gender, Female, n(%)	229	18.5
Year of BIC start, median (IQR)	2019	2019-2020
Year cART start, median (IQR)	2015	2011-2017
Age, years, median (IQR)	47	39-55
Age, >50 years, n(%)	544	43.98
Mode of HIV Transmission, n(%)		
Heterosexual	456	36.86
IVDU	100	8.08
MSM	622	50.28
Other/Unknown	59	4.77
HCVAb positive status, n(%)	129	10.43
HBsAg positive status, n(%)	49	3.96
AIDS, n(%)	203	16.41
CD4, cells/mmc, median (IQR)	702	505-928
CD4<350 cells/mmc, n(%)	140	11.3
CD4/CD8 ratio, median(IQR)	0.87	0.59-1.22
HIV-RNA, copies/mL, median (IQR)	0.30	0.00-1.38
LDL cholesterol, median (IQR)	120	100-145
HDL cholesterol, median (IQR)	49	41-58
Triglycerides, median (IQR)	116	83-168
Serum Glucose, median (IQR)	88	81-96
eGFR, CKD-EPI, ml/min, median (IQR)	89.5	77.2-101.8
Weight, kg, median (IQR)	74	66-82
BMI, Kg/m <sup>2</sup> , median (IQR)	24.2	22.2-26.9
Follow-up on BIC, years, median (IQR)	1.37	0.97-1.67
Previous ART-regimen		
INSTI-based	1061	85.77
NNRTI-based	95	7.68
PI-based	62	5.01
Other	19	1.54

### Primary Endpoint TF

112 TF occurred (9.1%, 14 VF and 98 TD). The 1-year probability of TF was 4.6% (95%CI 3.5,6.1), subgroups probabilities in Table 2

Table 2- KM 1-yr cumulative probability of TF overall and in the different groups

	1-yr cum. probability (95%CI)	log-rank p
Treatment Failure Overall	4.6% (3.5,6.1)	.
Age<50 years	4.8% (3.3,6.7)	0.103
Age>=50 years	4.5% (3.0,6.7)	
Female	7.5% (4.7,12.0)	0.009
Male	4.0% (2.9,5.5)	
Previous regimen NNRTIs	5.8% (2.5,13.5)	0.166
Previous regimen non-NNRTIs	4.5% (3.4,6.0)	

## CONCLUSIONS

- BIC/FTC/TAF as switch strategy demonstrated high effectiveness in real-life with 4.6% TF and 0.7% VF at 1-year.
  - Higher risk of TF in women seems mainly related to discontinuation of BIC/FTC/TAF for pregnancy concerns.
  - 4.1% of TD at 1-year, main cause of discontinuation was simplification
- Limits**
- These data should be confirmed with long-term follow-up
  - Few numbers on weight at 12 ( $\pm 3$ ) months from switch
